Contents

1 INTRODUCTION 1

The metal-forming process in history. Plane-strain slip-line fields: historical note. Physical observations. Bibliography.

2 GENERAL PLASTICITY THEORY 8

Introduction. Strain or strain rate and displacements, deformation and rotation. The equilibrium equations. The yield criterion. The plastic potential. Assumptions: the perfectly plastic rigid isotropic material; incompressibility; time effects, inertia. Discontinuity of velocity and stress. The virtual work equation. The maximum work principle. Uniqueness theorems. Upper-bound and lower-bound theorems. Summary in terms of physical interpretation of concepts. Bibliography.

3 BASIC THEORY OF PLANE PLASTIC FLOW 22

Definition of plane strain. Stress equations. Velocity equations. Definition of slip line and slip-line field. Hencky's first and second theorems. The hodograph. The Prager stress plane: cycloids. The validity of solutions-tests: rate of working, extension into rigid regions, overloading at singularities, permissible stress discontinuities. Bibliography.

4 APPLICATION TO SPECIFIC PROBLEMS 41

Types of solutions to equations: statically determinate, statically indeterminate. Constructing the slip-line field: first boundary problem, second boundary problem, third boundary problem. Geometric classification of slip-line fields, incipient fields, steady-state fields, geometrically similar fields. Stress boundary conditions: free surface, frictionless interface, partially rough interface, perfectly rough interface. Construction and properties of the hodograph. Distinction between slip-line field and upper-bound solution. Constructing the hodograph for the upper-bound solution. Bibliography.

5 APPLICATION TO PROCESSES: BIBLIOGRAPHY 54

Centred-fan fields. Pressure vessels. Compression: parallel and inclined dies. Indentation of a semi-infinite medium. Cutting, Sheet drawing. Extrusion and extrusion forging. Piercing. Forging. Orthogonal machining. Swaging. Yielding of notched bars in tension: crack initiation. Bending: cantilevers; notched bars. Rolling. Blanking and shearing. Analogy with metal-working operations. Bibliography.

6 PLASTICITY PROBLEMS FOR OTHER THAN PLANE-STRAIN CONDITIONS: BRIEF SURVEY OF LITERATURE 141

Introduction. Axial symmetry. Plane stress-definition: where basic equations are to be found. Anisotropy. Work-hardening and uniqueness. Impact. Soils. Bibliography.

APPENDICES 154

1. Suffix Notation and the Summation Convention
2. Characteristics of Partial Differential Equations
3. Nodal Points for Extension of Centred-fan Fields
