

MATHEMATICAL THEORY OF PLASTICITY

Hideaki Kudo, Professor of Faculty of Engineering, Yokohama National University

1968 (in Japanese)

FOREWORDS

SIGNATURES

1. INTRODUCTION (p.1)

1.1 What's Plasticity?

1.2 The Mathematical Theory of Plasticity

Exercises

2. YIELDING UNDER A SIMPLE STRESS (p.6)

2.1 Yielding in Tension

2.2 Simplification of Stress-Strain Relation

2.3 Analysis Some Simple Trusses

(1) Statically determinate truss

(2) Statically indeterminate truss

(3) Limit design

(4) Residual stress

2.4 Yielding in Compresure

2.5 Yielding in Simple Banding

(1) Premises and formulas for the analysis

(2) Elastic stage

(3) Elastic-plastic stage

(4) Entirely plastic stage

(5) Ultimate bending moment for a generic cross section

2.6 Statically Determinate Beam Having Rectangular Cross Section

(1) Elastic stage

(2) Elastic-plastic stage

(3) Plastic hinge

2.7 Statically Indeterminate Beam Having Rectangular Cross Section

(1) Elastic stage

(2) Ultimate load

2.8 Yielding in Simple Shear

2.9 Torsion of Circular Bar and Cylinder

(1) Premises and formulae for the analysis

(2) plastic stage

(3) Elastic-plastic stage

(4) Entirely plastic stage

2.10 Summary

Exercise

3. YIELDING UNDER COMBINED STRESSES (p.31)

3.1 Principal Stress and Shear Stress

(1) Plane state of stress

(2) Cubic state of stress

3.2 Yield Criterion

(1) Tresca's criterion

(2) Von Mises' criterion

(3) Experimental confirmation of the criteria

(4) Modified Tresca's criterion

(5) Yield criterion during plastic deformation

3.3 Thick Cylinder Subjected to internal Pressure

(1) Premises

(2) Elastic stage

(3) Elastic-plastic stage

(4) Entirely plastic stage

(5) Residual stress

3.4 Rotating Disc

(1) Premise

(2) Elastic limit angular velocity

(3) Elastic-plastic stage

(4) Ultimate angular velocity

3.5 Bending of Circular Plate Under Lateral Load

(1) Basic equations

(2) Elastic stage

(3) Entirely plastic stage

3.6 Torsion of Prismatic Bar

(1) Premises and stress function

(2) Elastic stage

(3) Elastic-plastic stage

(4) Entirely plastic stage

Exercises

4. ELEMENTARY ANALYSIS OF METAL FORMING (p 62)

4.1 Plane-Strain Compression

(1) Plane-strain

(2) Compression between parallel dies

(3) Compression between V-shaped dies

(4) Compression between inclined dies

(5) Compression between curved dies

4.2 Plane-Strain Steady State Forming

(1) Steady state forming

(2) Extrusion and drawing

(3) Rolling and roller-die drawing

4.3 Axisymmetric Compression Forming

(1) Compression of disc between parallel dies

(2) Drawing and extrusion of circular bar

(3) Drawing and extrusion of circular tube

4.4 Axisymmetric Deep-Drawing

4.5 Summary

Exercise

5. STRESS-STRAIN COMPONENTS RELATIONS (p.93)

5.1 Logarithmic Strain and Incremental Strain

5.2 Stress-strain Components Relation

(1) Elastic state

(2) Plastic state-Incremental strain theory

(3) Total strain theory

5.3 Elastoplastic Analysis of Plane Strain Compression

5.4 Examination of Assumptions Used in the Above Analyse a

(1) Expansion of circular cylinder by internal: pressure :

(2) Torsion of prismatic bar

(3) Axisymmetric compression, drawing and extrusion

(4) Bending of circular plate

5.5 Change of Sheet Thickness During Deep-Drawing

5.6 Summary

Exercises

6. BEHAVIOURS OF NONIDEALLY PLASTIC MATERIAL (p.115)

6.1 Material Characteristics in Tension and Compression

(1) Dependence of yield point upon strain-rate and temperature

(2) Dependence of yield stress upon strain-rate and temperature

6.2 Correlation Between Strain-Hardening Characteristics and Material Behaviour in Tension, Compression and Bending

- (1) Simple tension
- (2) Simple compression
- (3) Simple bending

6.3 Strain-Hardening Under Combined Stresses

- (1) Work of plastic deformation
- (2) Strain-hardening function
- (3) Complete stress-strain components relation
- (4) Strain-hardening in simple shear

6.4 Expansion of Thick Wall Cylinder Due to Internal Pressure

6.5 Use of Mean Yield Stress

- (1) In case of steady state forming
- (2) In case of nonsteady state forming

6.6 Creep

- (1) Creep phenomenon
- (2) Mathematical description

6.7 Creep Bending of Beam

6.8 Summary

Exercises

7. ANALYSIS OF PLANE STRESS PROBLEMS BY SLIP-LINE FIELD TECHNIQUE (p. 145)

7.1 Basic Equations for Stresses

- (1) Within plastic region
- (2) On boundary surface

7.2 Some simple Slip-Line Fields

- (1) Uniform stress field
- (2) Centred fan field

(3) Logarithmic spiral field

7.3 Method of Drawing Generic Slip-Line Field

(1) When stresses are specified along a curve

(2) When a set of intersecting α - and β slip lines are given

7.4 Indentation and Local Compression

(1) Indentation of flat punch onto semi-infinite body

(2) Indentation of: wedge into semi-infinite body

(3) Indentation of flat punch onto plate

7.5 Compression of Rectangular Bar

7.6 Tension of Notched Bar

7.7 Drawing and Extrusion

(1) Drawing through smooth die

(2) Extrusion

7.8 Other Problems

(1) Machining

(2) Friction

7.9 Distribution of Displacement in Deforming Body

(1) Basic equations

(2) Distribution of displacement in uniform stress field

(3) Distribution of displacement in centred fan field

(4) Deforming-nondeforming boundary

(5) Line of discontinuous displacement

7.10 Method of Determination of Displacement and Examples

(1) Hodograph

(2) Hodograph for indentation of flat punch onto semi-infinite body

(3) Tension of notched bar

(4) Hodograph and deformation pattern in extrusion

(5) Compression between rough dies

7.11 Summary

Exercises

8. LIMIT THEOREMS AND THEIR APPLICATION (p.198)

8.1 Generalisation of Yield Criterion and Flow Rule

- (1) Elastic potential
- (2) Plastic potential
- (3) Principle of maximum plastic work

8.2 Requirements in Solving Problem and Principle of Virtual Work

- (1) Requirements in solving problem
- (2) Admissible stress and displacement
- (3) Principle of virtual work

8.3 Variational Principles or Limit Theorems

- (1) The first variational principle or lower bound theorem
- (2) The second variational principle or upper bound theorem

8.4 Discontinuous Stress and Displacement Fields

- (1) Discontinuous stress field
- (2) Discontinuous displacement field
- (3) Mechanism of plastic hinge

8.5 Plane-Strain Tension of Bar Having Circular Notch

8.6 Upper-Bound Approach to Drawing and Extrusion Through Taper Die

- (1) Plane-strain
- (2) Axisymmetric deformation

8.7 Collapse of Plate Due to Lateral Load

- (1) Upper bound
- (2) Lower bound

8.8 Exact Solution and Uniqueness of Solution

(1) Exact solution

(2) Uniqueness of solution

8.9 Summary

Exercises
